
Effects are on the measured 2008-2019 change (positive = raises the measured 2019 value); the corrected change removes them.
Observed CI shown for daily time only (B2). Rounding: bounds from simulation (nearest vs round-up); other rows: 95% household-bootstrap CIs.
The corrected range combines the extremes of all rows. The short-trip row assumes the whole fall in trips under 5 min is measurement (an upper bound).
Residents 6+, weekdays with trips; round-trip days, destination purposes, local trips (≤ 80 km); harmonised motives. Sources: ENTD 2008, EMP 2019.
